## 0% detected as AI

The percentage indicates the combined amount of likely AI-generated text as well as likely AI-generated text that was also likely AI-paraphrased.

#### Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

### **Detection Groups**

1 AI-generated only 0%

Likely AI-generated text from a large-language model.

2 AI-generated text that was AI-paraphrased 0%

Likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

#### Disclaimer

Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (it may misidentify writing that is likely AI generated as AI generated and AI paraphrased or likely AI generated and AI paraphrased writing as only AI generated) so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

### **Frequently Asked Questions**

#### How should I interpret Turnitin's AI writing percentage and false positives?

The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI-paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (\*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

#### What does 'qualifying text' mean?

Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

## ASSIGNMENT FINAL REPORT

| Qualification         | Pearson BTEC Level 5 Higher National Diploma in Computing |                              |                  |  |  |  |  |  |

## **Plagiarism**

Plagiarism is a particular form of cheating. Plagiarism must be avoided at all costs and students who break the rules, however innocently, may be penalised. It is your responsibility to ensure that you understand correct referencing practices. As a university level student, you are expected to use appropriate references throughout and keep carefully detailed notes of all your sources of materials for material you have used in your work, including any material downloaded from the Internet. Please consult the relevant unit lecturer or your course tutor if you need any further advice.

## **Student Declaration**

I certify that the assignment submission is entirely my own work and I fully understand the consequences of plagiarism. I declare that the work submitted for assessment has been carried out without assistance other than that which is acceptable according to the rules of the specification. I certify I have clearly referenced any sources and any artificial intelligence (AI) tools used in the work. I understand that making a false declaration is a form of malpractice.

## **TABLE OF CONTENT**

## **TABLE OF FIGURES**

## **TABLE OF TABLE**

# A. Introduction

## **B.** Content

## I. Explore various forms of IoT functionality. (P1)

### 1. Introduction to the functionality of IoT.

The Internet of Things (IoT) is a novel paradigm that is rapidly gaining ground in the scenario of modern wireless telecommunications. The basic idea of this concept is the pervasive presence around us of a variety of things or objects - such as Radio-Frequency IDentification (RFID) tags, sensors, actuators, mobile phones, etc. - which, through unique addressing schemes, are able to interact with each other and cooperate with their neighbors to reach common goals (Atzori, Iera, & Morabito, 2010).

The Internet of Things (IoT) offers many benefits in optimizing processes or reducing operating costs and can improve work efficiency. The main functions of IoT include:

- Data collection and sensing
- Data connectivity and transmission
- Data processing and analysis
- Control and automation
- Security and privacy

#### 2. Functional forms of IoT

## 2.1. Data Collection & Sensing

The most important main function of IoT is to collect data from the environment through smart sensors. These sensors can collect parameters such as temperature, light, humidity, motion, air quality and energy consumption (Xu, He, & Li, 2014).

Common types of sensors in IoT:

- **Temperature and humidity sensors:** These are often used in smart agriculture and are used to measure humidity and temperature in the air. *For example*, in agriculture, the soil moisture sensor of the automatic watering system can help automatically water when the soil is dry or the user can customize the watering time and adjust the amount of water when watering, avoiding water waste and optimizing crop productivity.
- Light sensor: Helps support automatic lighting system adjustment, products that apply light sensors are
  often energy-saving and highly efficient. <u>For example</u>, when it is dark, the street lights automatically turn
  on. When it is light, the lights turn off. This is because the light sensor detects ambient light and controls
  the light switch.
- **Motion sensor:** is a smart sensor line that can detect and measure physical movement within a certain range. From there, the sensor will send a signal to other devices to operate according to a pre-set scenario. *For example*, the hallway light automatically turns on when someone enters.
- **Air quality sensors:** help monitor and check environmental pollution levels and help environmental managers implement appropriate measures to improve air quality.

#### 2.2. Connectivity and Data Transmission

After collecting data, IoT devices need to transmit data to the processing system through appropriate connection protocols (Razzaque et al., 2016).

Popular protocols:

- 2.3. Data Processing and Analytics
- 2.4. Control and Automation
- 2.5. Security and Privacy

- II. Review standard architecture, frameworks, tools, hardware and APIs available for use in IoT development. (P2)
  - 1. Introduction to IoT Development
- III. Investigate architecture, frameworks, tools, hardware and API techniques available to develop IoT applications. (P3)
- IV. Discuss a specific problem to solve using IoT. (P4)
- V. Employ an appropriate set of tools to develop a plan into an IoT application. (P5)
- VI. Create a detailed test plan and examine feedback. (P6)
- VII. Review the IoT application, detailing the problems it solves. (P7)

  Investigate the potential problems the IoT application might encounter when integrating into the wider system. (P8)
- VIII. Analyse the impact of common IoT architecture, frameworks, tools, hardware and APIs in the software development lifecycle. (M1)
- IX. Examine specific forms of IoT architecture, frameworks, tools, hardware and APIs for different problem-solving requirements. (M2)
- X. Plan the most appropriate IoT architecture, frameworks, tools, hardware and API techniques to include in an application to solve a problem. (M3)
- XI. Apply selected techniques to create an IoT application development plan. (M4)
- XII. Reconcile end-user feedback and determine advantages and disadvantages of chosen IoT techniques. (M5)
- XIII. Compare the final application with the original plan. (M6)
- XIV. Evaluate specific forms of IoT architecture and justify their use when designing software applications. (D1)
- XV. Make multiple iterations of the IoT application and modify each iteration with enhancements gathered from user feedback and experimentation (D2)
- XVI. Critically evaluate the overall success of the application including the potential impact of the IoT application on people, business and society, and the end user. (D3)
